About NEDO Project Success Stories

NEDO’s research and development projects aim to enhance quality of life and convenience. Behind every accomplishment is a story of how companies overcame daunting technical challenges to achieve commercialization.

NEDO carries out a post-project evaluation after a project is completed by conducting follow-up monitoring to determine how project results have spread throughout society. Based on the products and services identified in the monitoring, interviews are conducted with related companies, and then the products and services are introduced in NEDO Project Success Stories.
As of 2018, NEDO Project Success Stories have introduced 100 cases of technology development since the publication of such stories was started in 2008.

The results of 100 research and development projects are making contributions to addressing energy and global environmental problems and enhancing industrial technology.

This brochure outlines seven new cases of technology development leading to commercialization that were posted on NEDO’s Japanese language website.
