## Summary

This project aims to develop a distributed CO<sub>2</sub> recycling system that captures CO<sub>2</sub> from the atmosphere by membrane and converts it into carbon fuel.

Based on our innovative separation nanomembranes with world-leading CO<sub>2</sub> permeability and nanomembrane technology, the project will develop a CO<sub>2</sub> capture unit consisting of CO<sub>2</sub> separation nanomembranes with high CO<sub>2</sub> selectivity, and a highly efficient CO<sub>2</sub> conversion unit that converts the captured CO<sub>2</sub> into carbon fuel. These two units will be integrated into one system, named the “Direct Air Capture and Utilization” (DAC-U) system which can deliver a continuous process from CO<sub>2</sub> capture from the atmosphere through to carbon fuel conversion. This system provides the flexibility to adjust the performance of the system to meet requirements based on location, cost, application, and other local conditions. This innovative DAC-U system will enable the ubiquitous capture of CO<sub>2</sub> from the atmosphere and the recycling of CO<sub>2</sub> as a carbon fuel. Our goal is not only to solve the problem of climate change, but also to contribute to the realization of a carbon-recycling society based on Local Production Local Consumption.

## Targets by 2030

FY2022: Select basic materials for separation membrane with high CO<sub>2</sub> selectivity. Proof chemical conversion process of CO, CH<sub>4</sub>, and C<sub>2</sub>H<sub>4</sub> from CO<sub>2</sub> mixture gases.

FY2024: Development of CO<sub>2</sub> capture nanomembranes with CO<sub>2</sub>/N<sub>2</sub> and CO<sub>2</sub>/O<sub>2</sub> of ca. 30 and 10, respectively. Conversion of CO, CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub> from CO<sub>2</sub> mixture gases with the conversion efficiency of 8 to 30% by electrochemical way and continuous production of CO and CH<sub>4</sub>(yield:90%) by thermochemical process.

FY2029: Development of small DAC-U system integrated with CO<sub>2</sub> capture unit (concentration: over 1000 times, capture amount: 2 kg/day-CO<sub>2</sub>) and conversion unit to produce C1/C2 compound with the yield of more than 80%.

## Implementation

Kyushu University, Kumamoto University, Hokkaido University
